

WELDING METHOD:

Welding is a process of joining two metal parts together by melting them and fusing them together. It is a common method used in many industries, including construction, manufacturing, and repair work. There are several different welding methods, each with its own advantages and disadvantages. The most common methods are shielded metal arc welding (stick welding), gas metal arc welding (MIG), and gas tungsten arc welding (TIG).

Welding is a process of joining two metal parts together by melting them and fusing them together.
